jpolicy$placement <- factor(jpolicy$placement, labels=c("No", "Yes"))

# Generate new variables
jpolicy$age <- 2017 - jpolicy$year

## Consolidating the Location variable
##The rationale for this is explained below, but let's do all recoding here
jpolicy$data_location_simple <- dplyr::recode_factor(jpolicy$data_location, `0` = "No data policy", `1` = "No data policy", `2` = "No data policy", `3` = "No data policy", `4` = "No data policy", `5` = "No data policy", `6` = "No data policy")

jpolicy$data_location <- factor(jpolicy$data_location, levels = c("0", "1", "2", "3", "4", "5", "6"), labels=c("0", "1", "2", "3", "4", "5", "6"))

## Create a binary strictness variable for the with policy data
jpolicy$bin_strictness <- factor(ifelse(jpolicy$strictness == "Require", "Require", "Don't require"))

# List and remove duplicates
jpolicy$title[duplicated(jpolicy$title)]

## [1] "Comparative Studies in Society and History"
## [2] "Global Networks"
## [3] "Human Ecology"
## [4] "International Political Sociology"
## [5] "Review of International Organizations"
## [6] "Review of International Political Economy"
## [7] "Social Networks"
## [8] "Socio-Economic Review"
```

```
## [9] "Socio-Economic Review"
jpolicy_dedup <- distinct(jpolicy, title, .keep_all = TRUE)

# Create a subset with only journals that have a policy
jpolicy_with_policy <- subset(jpolicy, has_policy == "Yes")
# And one with without the duplicates
jpolicy_with_policy_dedup <- subset(jpolicy_dedup, has_policy == "Yes")
```

Policy by discipline

This generates *figure 1* and the total number of journals with a policy (the latter taken without duplicates)

```
jpolicy_dedup %>% dplyr::select(has_policy) %>% table()
```

```
## .
## No Yes
## 136 155
```

```
policyplot <- ggplot(data=jpolicy, aes(has_policy, group="discipline")) +
  geom_bar(aes(y = ..prop.., fill = factor(..x..)), stat="count") +
  geom_text(aes(label = scales::percent_format(accuracy=1)(..prop..),
                y= ..prop.. ), stat= "count", family= "Open Sans", size = 3, vjust = 1) +
  guides(fill=FALSE) +
  scale_fill_manual(values = c("red", "dodgerblue")) +
  labs(title = "Percentage of Journals with Data Policy by Discipline", y = "Percent", x = "Has Data Pol.
  scale_y_continuous(labels=scales::percent_format(accuracy=1)) +
  facet_wrap(~ discipline, nrow = 2) +
  theme(text = element_text(family = "Open Sans"), strip.text = element_text(face = "bold"), panel.grid

print(policyplot)
```

Percentage of Journals with Data Policy by Discipline

```
ggsave("Has Policy By Discipline.png", plot = policyplot)
```

```
## Saving 6.5 x 4.5 in image
```

Strictness by discipline

This generates *figure 2* and the number of journals with a strict policy. Using the whole dataset for the graph but only interested in the deduped journals for the number

```
jpolicy_dedup %>% filter(has_policy=="Yes") %>% dplyr::select(strictness) %>% table()
```

```
## .
```

```
## No policy Encourage Require
##          0         102         53
```

```
strictnessplot <- ggplot(data=jpolicy, aes(factor(strictness, labels=c("No policy", "Encourage", "Require"),
  geom_bar(aes(y = ..prop.., fill = factor(..x..)), stat="count") +
  geom_text(aes( label = scales::percent_format(accuracy = 1)(..prop..),
    y= ..prop.. ), stat= "count",family= "Open Sans", size = 3, vjust = 1) +
  guides(fill=FALSE) +
  scale_fill_manual(values = c("red", "dodgerblue", "green")) +
  labs(title = "Percentage of Journals by Strictness of Data Policy", y = "Percent", x = "Policy Strictness") +
  scale_y_continuous(labels=scales::percent_format(accuracy=1)) +
  facet_wrap(~ discipline, nrow = 2) +
  theme(text = element_text(family = "Open Sans"), strip.text = element_text(face = "bold"), panel.grid=FALSE)
print(strictnessplot)
```

Percentage of Journals by Strictness of Data Policy

```
ggsave("Policy Strictness by Discipline.png", plot = strictnessplot)
```

```
## Saving 6.5 x 4.5 in image
```

Policy by policy source

We're running this only on deduped journals with policy. This produces *figure 3*.

```
sourcestrictplot <- jpolicy_with_policy_dedup %>% ggplot(aes(x = as.factor(strictness), group="source")) +
  geom_bar(aes(x = strictness, fill = factor(..x..), stat="count")) +
  geom_text(aes(label = ..count..), stat= "count", family= "Open Sans", size = 3, vjust = 1) +
  guides(fill=FALSE) +
  scale_fill_manual(values = c("red", "dodgerblue")) +
  labs(title = "Strictness of Data Policy by Policy Source", y = "Number of Journals", x = "Policy Strictness") +
  scale_x_discrete(labels = c("Encourage", "Require")) +
  facet_wrap(~ source) +
  theme(text = element_text(family = "Open Sans"), strip.text = element_text(face = "bold"), panel.grid = element_blank())
print(sourcestrictplot)
```

Strictness of Data Policy by Policy Source

```
ggsave("Strictness by Policysource.png", plot = sourcestrictplot)
```

```
## Saving 6.5 x 4.5 in image
```

Data Policy and Journal Ranking

The regressions underly the “Data Policy by Journal Ranking and Age” section. We only report estimated effect sizes for statistically significant effects. The predicted effects and CIs are taken from the `head()` and `tail()` of the `cplot` for each regression.

Predicted probability of having a data policy by Impact Factor

Let's do the same thing but with strictness. We're limiting this, again, to journals with a policy

```
## we now run this as a logit model with just the journals that have a policy
```

```
jpolicy_with_policy_dedup %>% dplyr::select(bin_strictness) %>%summary()
```

```
##      bin_strictness
```

```
## Don't require:102
```

```
## Require      : 53
```

```
strictnessmodel <- glm(bin_strictness ~ discipline + IF, data = jpolicy_with_policy_dedup, family = binomial)
summary(strictnessmodel)
```

```
##
```

```
## Call:
```

```
## glm(formula = bin_strictness ~ discipline + IF, family = binomial,
##      data = jpolicy_with_policy_dedup)
```

```
##
```

```
## Deviance Residuals:

```

The effect of IF on the strictness of data is quite weak if at all existent. Let's try the same with ranking, which measures the same thing but gives much less impact to outliers at the top.

We create the figure as both Cplot and ggplot, but will use the ggplot as **Figure 4a** in the table.

```
policyRankingmodel <- glm(has_policy ~ discipline + ranking, data = jpolicy_dedup, family = binomial)
summary(policyRankingmodel)
```

```

Data Location by Discipline

This is the graph using the full location categorization. We're collapsing categories 1-3 as there are hardly any journals in 1 and 3, making this graph unnecessarily cluttered.

```
ggplot(data=jpolicy_with_policy) + geom_bar(mapping = aes(x = data_location)) + facet_wrap(~ discipline
```

We have above recoded the location variable and this code produces *figure 6* as well as the numbers given in the “Where do journals tell authors to share data?” section of the analysis.

```
datalocDisciplinePlot <- ggplot(data=jpolicy_with_policy, aes(data_location_simple, group="discipline")) +  
  geom_bar(aes(x = data_location_simple, fill = factor(..x..)), stat="count") +  
  geom_text(aes(label = ..count..), stat= "count", family= "Open Sans", size = 3, vjust = 1) +  
  guides(fill=FALSE) +  
  scale_fill_manual(values = c("red", "dodgerblue", "green")) +  
  labs(title = "Location of Data by Discipline", y = "Number of Journals", x = "Location") +  
  facet_wrap(~ discipline, nrow = 2) +  
  theme(text = element_text(family = "Open Sans"), strip.text = element_text(face = "bold"), panel.grid  
print(datalocDisciplinePlot)
```

Location of Data by Discipline

```
ggsave("Location of Data by Discipline.png", plot = datalocDisciplinePlot)
```

```
## Saving 6.5 x 4.5 in image
```

Data Location by policy source

This produces **figure 7**

```
datalocSourcePlot <- ggplot(data=jpolicy_with_policy_dedup, aes(data_location_simple, group="source")) +
  geom_bar(aes(x = data_location_simple, fill = factor(..x..)), stat="count") +
  geom_text(aes(label = ..count..), stat= "count", family= "Open Sans", size = 3, vjust = 1) +
  guides(fill=FALSE) +
  scale_fill_manual(values = c("red", "dodgerblue", "green")) +
  labs(title = "Location of Data by Policy Source", y = "Number of Journals", x = "Location") +
  facet_wrap(~ source) +
  theme(text = element_text(family = "Open Sans"), strip.text = element_text(face = "bold"), panel.grid
print(datalocSourcePlot)
```

Location of Data by Policy Source

```
ggsave("Location of Data by Policy Source.png", plot = datalocSourcePlot)
```

```
## Saving 6.5 x 4.5 in image
```

Data Strictness by TOPS

Let's first look at whether TOP signers are more likely to have a policy. This and the following tables produce the numbers reported in the section "Effect of TOP and DA-RT on data policies"

```
table(jpolicy_dedup$TOPS, distinct(jpolicy, title, .keep_all = TRUE)$has_policy)
```

```
##
##      No Yes
## No  133 133
## Yes   3  22
```

Among those journals with a data policy, does TOPS correlate with a stronger policy? We're using the binary variable we generated above

```
table(jpolicy_with_policy_dedup$TOPS, jpolicy_with_policy_dedup$bin_strictness, useNA = "no")
```

```
##
##      Don't require Require
## No      86      47
## Yes     16       6
```

We did check TOP journals by discipline to see if this was driving the results. It is not and we don't report this in the paper

```
ggplot(data=jpolicy) + geom_bar(mapping = aes(x = TOPS)) + facet_wrap(~ discipline, nrow = 2)
```

DA-RT

Let's see if DA-RT also affects the strictness of policy among journals who have one at all:

```
table(jpolicy_with_policy$DART, jpolicy_with_policy$bin_strictness, useNA = "no")
```

```
##
##      Don't require Require
## No          12         4
## Yes          3         11
```

```
jpolicy_with_policy %>%
  drop_na(DART) %>%
  ggplot() + geom_bar(mapping = aes(x = bin_strictness)) + facet_wrap(~ DART, nrow = 2)
```

Here are the tables for JETS/DA-RT. We're running this on the whole dataset since DART is only coded for polisci anyway, so there are no duplicates..

```
table(jpolicy$DART, jpolicy$has_policy, useNA = "no")
```

```
##
##      No Yes
## No  19 16
## Yes  1 14
```

Qualitative Data by Discipline

Finally, we're interested to see how many journals talk about qualitative data. We're only looking at the journals that have any policy. The below table and graph are the source for the numbers in the section "Data policies and qualitative data"

```
table(jpolicy_dedup$qual_data)
```

```
##
## No mention  Implicit  Explicit
##      167      113      11
```

```
qualdataPlot <- ggplot(data=jpolicy_dedup, aes(x = qual_data, group="discipline")) +
  geom_bar(aes(x = qual_data, fill = factor(..x..)), stat="count") +
  geom_text(aes(label = ..count..), family= "Open Sans", size = 3, stat= "count", vjust = 1) +
  guides(fill=FALSE) +
  scale_fill_manual(values = c("red", "dodgerblue", "green")) +
```

```

labs(title = "Mention of qualitative data in policy by discipline", y = "Number of Journals", x = "Men
facet_wrap(~ discipline, nrow=2)+
theme(text = element_text(family = "Open Sans"), panel.grid = element_blank())
print(qualdataPlot)

```

```

ggsave("Qualitative Data by Discipline.png", plot = qualdataPlot)

```

```

## Saving 6.5 x 4.5 in image

```

Benefits

This calculates the figures in the “Recommendation” section under “Include the benefits of data sharing”

```

table(jpolicy_with_policy_dedup$benefits, jpolicy_with_policy_dedup$source)

```

```

##
##      No policy Journal Publisher Association
## No      0      55      34      20
## Yes     0       6      40       0

```
